

JIAHENG LI

FULL-STACK SOFTWARE ENGINEER | END-TO-END DELIVERY

Auckland, New Zealand | Open to relocate | odell.lijiaheng@gmail.com | 027 295 9309 | github.com/Ode11

Open Work Visa valid until 25 February 2029 | Available immediately

PROFESSIONAL SUMMARY

Full-stack software engineer with around three years of commercial experience across enterprise ERP/SaaS, engineering software and New Zealand client delivery. Owns the complete lifecycle from stakeholder discovery and domain modelling through C#/.NET or Java/Spring APIs, React/TypeScript interfaces, relational data design, testing, CI/CD and release. Proven in converting ambiguous specialist workflows into maintainable systems, modernising manual processes and improving data-intensive backend reliability.

CORE TECHNICAL CAPABILITIES

- Full stack: C#, .NET 9/10, ASP.NET Core Web API, Java, Spring Boot, Spring MVC, Servlets, React 18, Next.js, TypeScript and Vite.
- Data: Oracle, MySQL, PostgreSQL, SQLite and MongoDB; SQL Server coursework; relational modelling, normalisation, joins, transactions, indexing and query optimisation; MyBatis, MyBatis-Plus and Prisma ORM.
- Architecture: REST API contracts, layered services, domain modelling, SOLID, design patterns, DDD concepts, authentication, concurrent processing, WebRTC, WebSocket and distributed systems fundamentals.
- Delivery and cloud: CI/CD, Git/GitHub workflows, Vercel, AWS, Azure, Terraform, Linux, Windows Server, VPS and cloud instance configuration.
- AI-enabled engineering: RAG, MCP servers, agent development and repository-level AI coding workflows with controlled Git diffs, testing and review.

SELECTED TECHNICAL PROJECTS

Skyline Beam Calculation Platform | Full-stack Developer

Tech: .NET 9/10, C#, ASP.NET Core Web API, React, TypeScript, Vite, SQL

- Owned discovery through release, guiding structural engineers to identify known and uncertain inputs, outputs and validation rules, then translating an Excel beam-calculation workbook into typed domain models and maintainable services.
- Designed the calculation kernel and API contracts for geometry, supports, loads, reactions, shear, moment, design checks and calculation-book output; delivered the browser workflow and database-backed user functions independently.

p2p-lockstep-kit | Creator and Open-source Developer

Tech: TypeScript, WebRTC DataChannel, WebSocket, finite-state machines | [GitHub](#)

- Designed a browser-first lockstep toolkit with signalling, session lifecycle management, state-hash validation, snapshot synchronisation and reconnect recovery for deterministic turn-based applications.

NX-Cast | Open-source Developer

Tech: C, libnx, DLNA/UPnP, SSDP, SOAP, GENA, FFmpeg, libmpv, OpenGL | [GitHub](#)

- Built a DLNA DMR media receiver for Nintendo Switch homebrew, integrating network discovery and control protocols with native media playback and rendering pipelines.

Haven Build Group AD website | Commercial Client Delivery

Tech: React 18, TypeScript, Vercel, responsive UI, SEO | [Live site](#)

- Delivered a NZD 2,000 production website for a non-technical New Zealand client, taking responsibility for requirements, content structure, visual direction, deployment and ongoing IT support.

PROFESSIONAL EXPERIENCE

Skyline Consulting Engineers Limited | Part-time Full-stack Software Developer

Auckland, New Zealand | Oct 2024 - Dec 2025

- Operated as the company's sole software developer, taking ownership of requirements analysis, architecture, implementation, testing, stakeholder validation, CI/CD and release for an engineering calculation platform.
- Rebuilt the SP1 Excel beam calculation workflow as a C#/.NET 9 application and later upgraded it to .NET 10, separating the calculation kernel, API boundary, persistence and React/TypeScript user interface.
- Established calculation interfaces and extensible domain models for section libraries, load builders, support conditions and generated results while keeping source data separate from runtime and derived calculation state.
- Worked directly with non-technical engineers: used diagrams, annotated screenshots, email feedback and focused meetings to resolve uncertain requirements without unnecessarily interrupting client work.

Yonyou Network Technology Co., Ltd. | Junior Backend Developer (Java)

Zhengzhou, China | Mar 2022 - Dec 2023

- Developed backend APIs and secondary SaaS features for a front-end/back-end separated enterprise ERP platform using Java, Spring Boot, Spring MVC, Servlets, RestTemplate, MyBatis and Oracle.
- Built a quick-login integration service and delivered the message-push module end to end; introduced thread-pool processing for workloads exceeding 100,000 records to improve throughput and delivery stability.
- Contributed to a custom Java data-migration service processing up to approximately one million records per day, moving from handwritten MyBatis SQL toward MyBatis-Plus mappings to standardise team delivery while retaining custom SQL where necessary.
- Worked with complex ERP and finance schemas, decomposing oversized retrieval flows into bounded database queries and application-side data composition where this improved maintainability, parallelism and consistency of implementation across developers.
- Mentored an intern through production code examples, enterprise data-retention conventions and proactive check-ins; encouraged questions, explained review feedback and helped the developer improve without creating unnecessary pressure.

Optimal Drainage & Traffic Services Limited | Part-time IT Support

Auckland, New Zealand | Jun 2024 - Oct 2024

- Provisioned and administered computers, user accounts and business application access for a 10-person team.
- Collected and organised digital evidence supporting pre-litigation action in an intellectual-property infringement matter.

EDUCATION

Master of Information Technology - The University of Auckland, New Zealand | Jul 2024 - Nov 2025

Bachelor of Network Engineering - Henan University, China | Sep 2018 - Jun 2022
